## String Methods

Python has a set of built-in methods that you can use on strings.

**Note:** All string methods return new values. They do not change the original string.

| Method         | Description                                                                              |
|----------------|------------------------------------------------------------------------------------------|
| capitalize()   | Converts the first character to upper case                                               |
| endswith()     | Returns true if the string ends with the specified value                                 |
| find()         | Searches the string for a specified value and returns the position of where it was found |
| index()        | Searches the string for a specified value and returns the position of where it was found |
| isalnum()      | Returns True if all characters in the string are alphanumeric                            |
| isalpha()      | Returns True if all characters in the string are in the alphabet                         |
| isdigit()      | Returns True if all characters in the string are digits                                  |
| isidentifier() | Returns True if the string is an identifier                                              |
| islower()      | Returns True if all characters in the string are lower case                              |
| isspace()      | Returns True if all characters in the string are whitespaces                             |

|--------------|-----------------------------------------------------------------------------|
|              |                                                                             |
| istitle()    | Returns True if the string follows the rules of a title                     |
| isupper()    | Returns True if all characters in the string are upper case                 |
| join()       | Joins the elements of an iterable to the end of the string                  |
| lower()      | Converts a string into lower case                                           |
| replace()    | Returns a string where a specified value is replaced with a specified value |
| split()      | Splits the string at the specified separator, and returns a list            |
| startswith() | Returns true if the string starts with the specified value                  |
| strip()      | Returns a trimmed version of the string                                     |
| title()      | Converts the first character of each word to upper case                     |
| upper()      | Converts a string into upper case                                           |
