What is Python?

Python is a general purpose, dynamic, high level, and interpreted programming language. It supports Object Oriented programming approach to develop applications. It is simple and easy to learn and provides lots of high-level data structures.

Python is easy to learn yet powerful and versatile scripting language which makes it attractive for Application Development.

Python's syntax and dynamic typing with its interpreted nature make it an ideal language for scripting and rapid application development

Python supports multiple programming pattern, including object oriented, imperative, and functional or procedural programming styles. We don't need to use data types to declare variable because it is dynamically typed so we can write `a=10` to assign an integer value in an integer variable.

Python makes the development and debugging fast because there is no compilation step included in Python development, and edit test debug cycle is very fast.

The implementation of Python was started in December 1989 by Guido Van

Python History

- Python was invented by **Guido van Rossum** in 1991 at CWI in Netherland. The idea of Python programming language has taken from the ABC programming language or we can say that ABC is a predecessor of Python language.
- There is also a fact behind the choosing name Python. Guido van Rossum was a fan of the popular BBC comedy show of that time,

"Monty Python's Flying Circus". So he decided to pick the name **Python** for his newly created programming language.

Python has the vast community across the world and releases its version within the short period

Why Python?

- Python works on different platforms (Windows, Mac, Linux, etc).
- Python has a simple syntax similar to the English language.
- Python has syntax that allows developers to write programs with fewer lines than some other programming languages.
- Python runs on an interpreter system, meaning that code can be executed as soon as it is written. This means that prototyping can be very quick.
- Python can be treated in a procedural way, an object oriented way or a functional way.
